

Not New Business, Yet Lucrative!

Dear Readers,

Injection molding in INDIA is an age old business and any Tom, Dick or Harry knows it well, rather claim to know well.

As all know and have seen, there are hundreds of items with thousands of designs and 'n' number of colors and variations, the molded articles are available, thrown and imposed at times in the market. The fast changing people and faster changing tendencies of imitators assist this business to carry on.

Still one item or article is majorly ignored by many investors in INDIA. **Injection Syringe.**

The Business demands investment in Machinery for about Rs 2.01 Cr which is in fact not a big amount for many enthusiast investors in INDIA. Against which profit possibility of 59.77 Lac is not bad!

Have a look at the figures below.

Machinery cost	20896000
Land Cost Assumed to arrive at project cost, with expansion in mind.	7500000
Building 4675 Sq Feet	3272500
Utilities	2750000
Installation Cost	500000
Consultant's cost	150000
Total project Cost	35068500
Production per Year Average Nos. of syringes	21565440
Profit per Year possibility	5977940

The entire set up of machinery, [except Barrel + Plunger assembly which is Chinese Best] can made in INDIA inclusive of Highest possible quality molds as needed.

The set up within the above assumed cost is for the best class from where you can export as well; well sterilized and packed syringes can be prepared.

Why this business:

- 1) For the product, there is **no** custom to use or even demand the established brand.
- 2) Go to the market and ask for the syringe: Most places you cannot get so-called established brand/s.
- 3) Meaning there is no National brand or brands those are demanded, no brand or brands are registered in to the brains of people.
- 4) The patients and crowds, who are sick, who are the relatives of sick, the populous Nation, unorganized market and illiterate class of people neither are used to or not enough educated to identify the quality of brand for the health aspects in this country even these days, my challenge is, not even in big cities. (Cities have become big in INDIA with the rural sector rush, the people are again not enough literate of trained on anything, the demand of human power has pulled them in to the cities, making towns in to cities: Are Mumbai and Delhi not perfect examples?)
- 5) Talk of the few areas in the cities of INDIA which have literate enough class of people who demand the brands even for the health sector, go to other newly developed areas and out skirts of the cities, people are absolutely ignorant about the quality and class and so this curse can be converted in to blessing to sell. We do not recommend pushing the inferior quality; the new brand can have scopes to enter in to easily.
- 6) Nor there is any rocket science to produce this product.
- 7) Has lot of potential to export market, HUGE market.
- 8) The product is demanded day in and day out, the entire world's Gutter nations need medication and such equipments and instruments in quantities and with continuous frequency.
- 9) The populous Nations have issues of continuous population explosion; uncontrolled democracy allows INDIA kinds of hot nations to offer innumerable human units who need injections syringes, and in fact many such consumable items. [CHINA controlled due to non-democracy, others cannot.]
- 10) Make Quality and command the market with infusion of higher capital and be the Market KING, this offer is still awaiting this product, Trust us.

Injection molding is not just about the Bucket and tumblers or just furniture, has luster still with it. WELCOME.
