

Wood + HDPE and WOOD + PVC Wall & Ceiling profiles

Please note as below which companies from CHINA would not inform.

There are two types of profiles that are made:

**1) Wood powder + HDPE + Additives:**

And

**2) Wood Powder + PVC + Film laminated on the top of it.**

Let us understand in detail:

- 1) **Wood powder + HDPE [ High Density Polyethylene ] + additives' made profile** will be mostly in two layer { Can be made in one layer also BUT usually is made in two layers with the outer layer is as colored portion which comes from the machine itself. }

Plant for such way making profiles can cost approximately Rs. 1.6 Cr. landed, in case purchased from a high class and renowned WPC machinery and profile manufacturer in CHINA.

- 2) **Wood powder + PVC + Film laminated on top of it:** This is a single step process to make the profiles and then the films are laminated on the profiles, different colored and designed films are available and are laminated post the profiles are made, The production steps shall be as below:

The plant for such System can cost about Rs 1.55 Cr. landed in case purchased from a high class and renowned WPC machinery and profile manufacturer in CHINA.

Other cheaper plants also available.

And each time we need to change the die when we need different shape and size for which we need to buy Dies along with the plant/s. it can cost 6500 / 7000/9000/ 10000 USD FOB CHINA plus duties.

I shall further explain in case you finalize this project.

In the meantime please note that you shall need 5000 Sq Feet space to make such product with one line and in case you wish to have more than one line or even more, we need to calculate again for the space.

-----  
Thanks and Regards,

Kamal Shah,
